

## Seminar

### **„OPTIMIZATION OF GRASS FEED PRODUCTION ON LIVESTOCK FARMS USING INNOVATIVE TECHNOLOGIES“**

Participants will learn about the physiological needs of high-yield dairy cows, balancing their diet with protein, metabolic energy, and high fiber digestibility. The biological and agricultural properties of the most important forage legumes and grasses, the principles of creating productive grass mixtures, the technology of establishing new grassland, and the use of green mass for the production of high-quality grass feed will be discussed. The innovative use of legumes allows dairy farms to manage the costs of protein supplements and mineral fertilizers more efficiently. Translated with DeepL.com (free version).
