„FROM SOIL TO WARNING: HOW MODERNIZED IKMIS HELPS SOLVE REAL FIELD PROBLEMS“

The modernized IKMIS presents significant system updates designed for more accurate, faster, and data-driven decision-making on farms. What's new? Expanded and densified weather station infrastructure, automated spatial data integration (satellite and drone data), a soil monitoring database, and a new, customizable automatic alert system. These improvements help farmers identify risks earlier, gain clearer insights into field conditions, and plan agricultural operations more efficiently - all through one reliable digital platform.
